when we began to consider the scope of this book we envisaged a catalogue supplying at least one abstract definition for any finitely generated group that the reader might propose but we soon realized that more or less arbitrary restrictions are necessary because interesting groups are so numerous for permutation groups of degree 8 or less i e subgroups of  $e$  the reader cannot do better than consult the 8 tables of Josephine Burns 1915 while keeping an eye open for misprints our own tables on pages 134 143 deal with groups of low order finite and infinite

groups of congruent transformations symmetric and alternating groups linear fractional groups and groups generated by reflections in real euclidean space of any number of dimensions the best substitute for a more extensive catalogue is the description in chapter 2 of a method whereby the reader can easily work out his own abstract definition for almost any given finite group this method is sufficiently mechanical for the use of an electronic computer there is also a topological method chapter 3 suitable not only for groups of low order but also for some infinite groups this involves choosing a set of generators constructing a certain graph the cayley diagram or dehnsehe gruppenbild and embedding the graph into a surface cases in which the surface is a sphere or a plane are described in chapter 4 where we obtain algebraically and verify topologically an abstract definition for each of the 17 space groups of two dimensional crystallography
